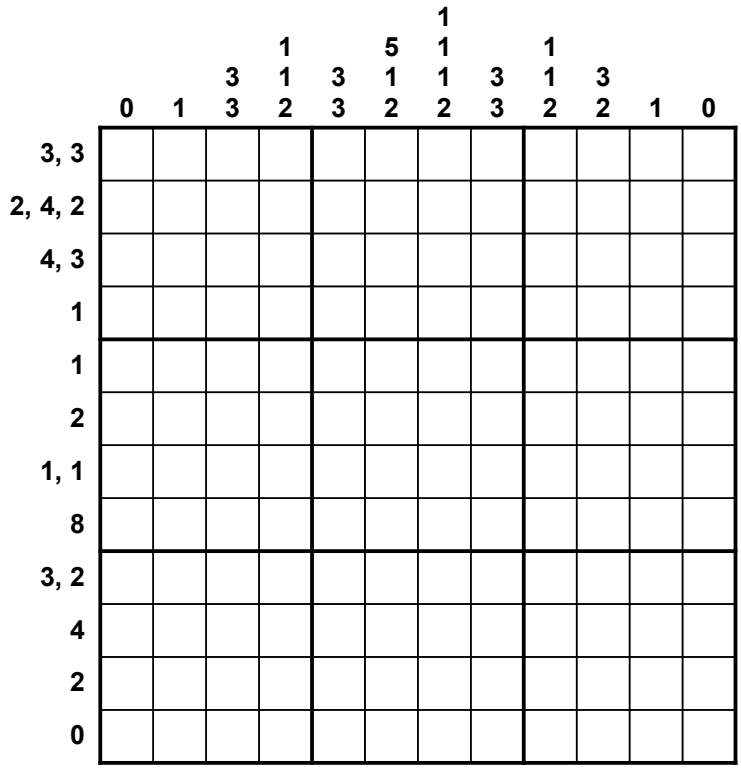
Puzzle 1 : *A Quick Warm-Up Puzzle:* **Smiler**



Hanjie is a logic puzzle where you must work out whether each individual square in the puzzle is to be filled in or left blank.

Most people use a pencil to solve hanjie puzzles, but if you are confident you can use a pen instead - as long as you don't make mistakes!

Once complete, you will create a simple black-and-white image... the wording at the top of the puzzle is a clue to the image that you will create.

You never need to guess when solving our hanjie puzzles, and each puzzle has just one solution that can be reached through a logical solving approach.

The numbers at the start of each row and at the top of each column indicate how many squares are to be shaded in in that region. A '0' means no squares are to be filled in. Most people like to mark squares they know are to remain empty with a dot.

Each number indicates how many filled squares there are next to each other. There must be a gap of at least one blank cell between groups of filled squares: thus the clue 1,1 means that there is at least one empty square between the two individual filled squares. If you've not solved hanjie before, take a peek at the first solution to get a feel for how the clues help you work out the solution.

This magazine contains 50 all-new hanjie puzzles for you to enjoy. The solutions are at the back if you get stuck or want to check your answer is correct!
